Abstract. This paper is our test for citation parsing. We need some text here to make it look like a real paper. In this study, we evaluate the performance of CERMINE, a PDF parser designed for extracting scholarly information, particularly citations, from academic documents. The evaluation entails a comprehensive analysis of CERMINE's ability to accurately parse citations across diverse datasets encompassing various disciplines and publication formats. Through systematic testing and comparison with ground truth data, we assess CERMINE's efficacy in recognizing citation patterns, handling variations in citation styles, and extracting metadata such as authors, titles, publication years, and journal names. Additionally, we investigate the parser's robustness in handling complex layouts, non-standard document structures, and citations embedded within tables, figures, and footnotes. Our findings shed light on the strengths and limitations of CERMINE, providing insights into its applicability for automated bibliographic management, citation analysis, and digital library development. The results presented herein contribute to the ongoing efforts in enhancing the accuracy and reliability of PDF parsing tools for scholarly communication and information retrieval.
